**Plant, Soil and
Microbes**

Beneficial soil microbes form symbiotic relationships with the plant. In fact, the plant will exert as much as 30% of its energy to the root zone to make food for microbes. In return those microbes not only protect the plant from stress, but also feed the plant by converting and holding nutrients in the soil.

A gardeners job is to increase the number of microbes in the soil, and to provide the food they need to be productive. When this is done properly, plants grow well and soil is improved. There is no question that microbes

available fertilizer.
Active roots supply
25-45% of their total
root carbohydrates to
feed the microbes. The
plants feed the soil
microbes sugars and
the microbes supply
the plant with amino
acids, soil nutrients,
and water.
