The rubber specimens were heat-aged in an oven at the temperature ranging from 70 °C to 100 °C for a period from 1 to 180 days. Compression set results changes as the threshold are used for assessment of the useful life and time to threshold value were plotted against reciprocal of absolute temperature to give the Arrhenius plot.

Rubber material properties, and useful lifetime prediction and evaluation are very important in the design procedure to assure the safety and reliability of rubber components. We have been interested for many years in predicting the lifetimes of rubber materials in oxygen-containing environments using a combination of accelerated aging tests and extrapolation models.

useful in assessment for learning because they contain qualitative descriptions of performance criteria that work well within the process of formative evaluation. In recent years, many educational researchers have noted the instructional benefits of scoring rubrics (for example, Arter & McTighe, 2001; Goodrich Andrade, 2000).

Synthetic rubbers have usually been developed with specific properties for specialist applications. The synthetic rubbers commonly used for tyre manufacture are styrene-butadiene rubber and butadiene rubber (both members of the Buna family). Butyl rubber, since it is gas-impermeable, is commonly used for inner tubes. Table
